There's no financial reason for photography novices to buy Photoshop, but if you're a beginner or professional working in post-processing, you must buy a copy (or several) of Photoshop. PaintShop Pro PaintShop Pro is the best photo-editing and post-processing program for beginners. Its unique features include layers, the Smart Brush, camera raw-file support, and a lot more that I'll describe later in this chapter. It's good for both straight retouching and manipulation of RAW files. Like Photoshop, PaintShop Pro is a raster-based program that enables you to add and modify content in images. The program includes proprietary editing tools, such as layer editing, channel blending, and opacity masks. Although PaintShop Pro includes a few extensions that give you more capabilities and more powerful tools than those included with the standard version, its pro-level features remain missing in the consumer version. You can find some great tutorials on the web for beginners who want to become proficient at using PaintShop Pro.

Estimating gross national product and productivity: a brief history. This review of the use of GNP and productivity in the United States at the national level during the twentieth century attempts to consider the fact/use relationship. It attempts to give a survey of the history of the use of GNP/productivity estimates during the various periods of economic growth in this country. Prior to World War I, productivity estimates became highly correlated with GNP estimates and remained that way until the Great Depression. Since then, the two types of estimates, while somewhat correlated, have remained separate. There is no single cause which can explain this, but certain facts certainly are pertinent. After World War II, there was an attempt by growth economists to synchronize GNP estimates with the reporting of national accounts, using a method of rectifying the excess. The method of rectification was appropriate at the time, and undoubtedly did offer much insight into the theoretical construct of national accounts. However, in order to link GNP/productivity with national accounts, a sophisticated infrastructure was built up. As we move into the 1980s, there is no justification for the existence of such an infrastructure. We need to recognize that GNP estimates do not necessarily take into account the operations and results of the non-financial economy in proportion to their importance to the total national economy. We need to review the necessary infrastructures of national accounting and their theoretical basis. Before we can begin to use GNP estimates we must ask why such estimates have been developed and why they are currently being used. group.table.properties
