This program removes the data that old programs use to create thumbnails for your pictures. Thumbnail data is the data used by Windows and many other programs to create the thumbnail-sized files that appear next to a folder on your desktop. They are used when you try to rename a folder or remove a file from a directory, for example. The problem with many programs is that they use a lot of data in creating the thumbnails, and because they use a lot of different data they create

more and more files as more files get added to your computer. By the way, this program does not delete thumbnails. It does not change the names of any of your pictures, or corrupt them in any way. It does only remove data that old programs use to create thumbnails. How to use: First, when you choose the location to look at, you must check "Subdirectories". So you will have to look in all subdirectories as well. One caveat: Some of the old software create thumbnails in the same folder as where they are, like My Pictures. That folder is one of the first places to go when we look for the files. While it seems like a good idea, it has one big problem: At the time we run this program it does not bother to sort through the subdirectories of My Pictures, as it is quite slow. Right click and select "delete" When you've finished looking through the folder, you can right-click any file and select "delete" to remove the files from the folder. You also have the option to select files (right-click and select "select all") or add them to the selection (right-click and select "deselect all"). You can see more about the program at: This software will help you to clean the thumbnail cache, as its name hints at.
